Minimize the amount of states a user has to navigate through for each section. (minimal pop-ups, etc)

Establish a basic user interface consistent with modern application and website navigation themes.

Structure visual elements for intuitive use among new, existing, and out of country users.

Target Audience: Veterinarians and Epidemiologists. (Educated in this field)

Description

The description of the scenario.

Submit

Copy

Delete

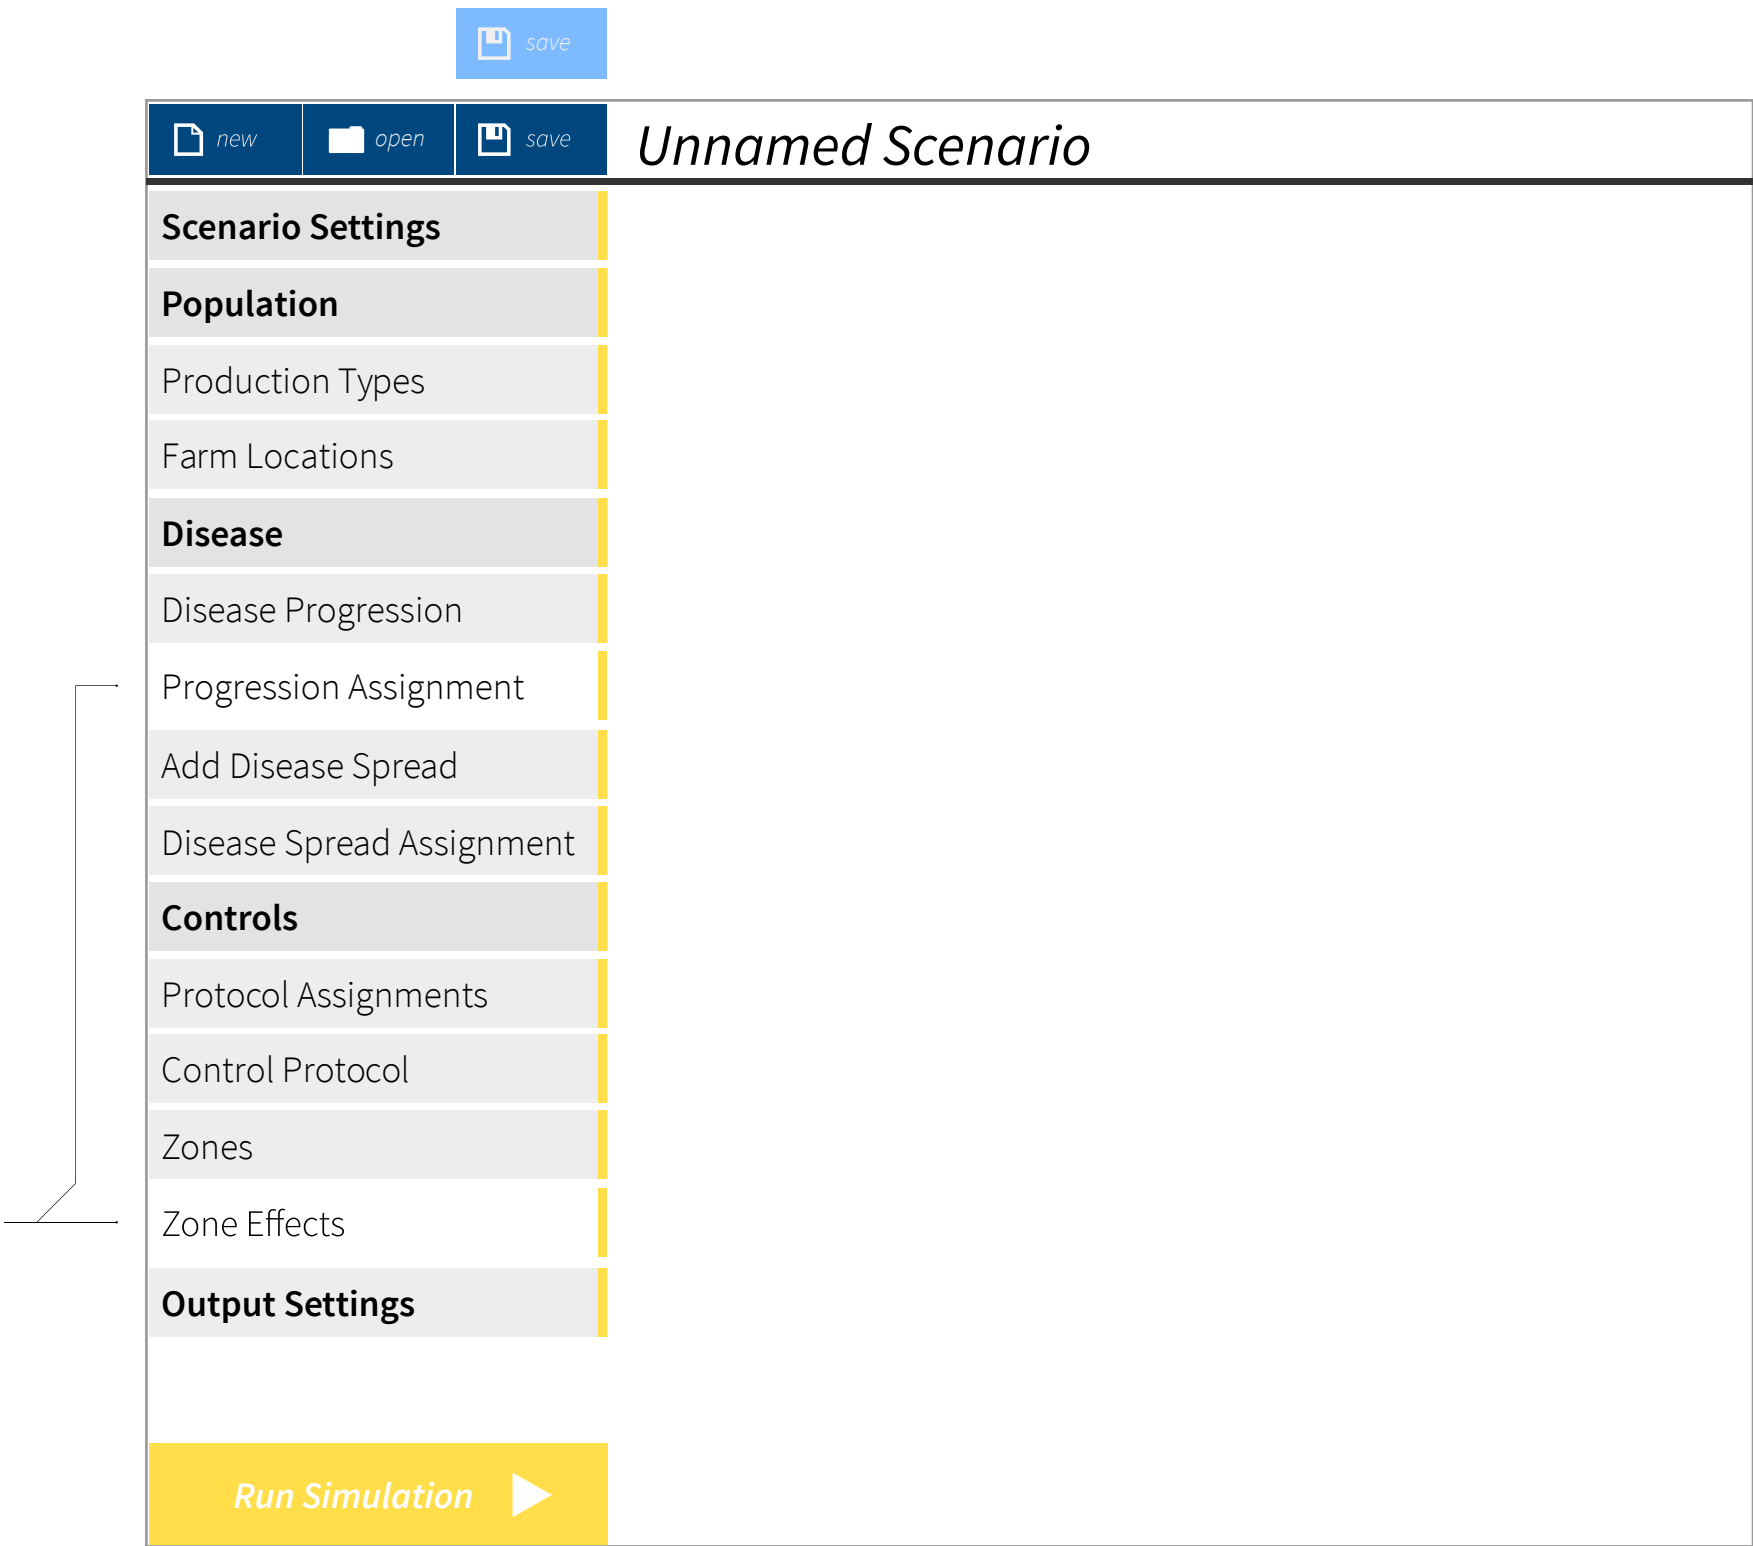

Cleaning up the user interface will allow for quick, intuitive navigation throughout the program. Goals would include the following:

- Adding a visual system for progress tracking
- Arranging elements within the application for unobtrusive, yet intuitive placement.
- Introducing simple icons where needed to introduce a familiar visual for new, foreign, and existing users.

Save button would appear with lighter background, indicating unsaved changes to the scenario

Rearrangement of header elements allows for tabbed browsing in the future, in addition to visually organizing the space.

White elements on the left navigation bar would normally be accorded in, showing when the user clicks the button above it. (ie, Disease Progression and Zones)

“all green” lets the user Run Simulation

Having a visual representaiton for accomplishment adds another layer of reason for the task at hand. Simply put “I must make all the task bars green” eases the user into the many steps she will need to take to actually get a simulation running.

Conversely, it must be easy for the user to validate exceptions to avoid frustrations. (Ex: Disable all controls, which should mark the “Controls” section as green.)

User selection is indicated by a darker button color

Output Settings is now the last thing users will interact with before reaching the “all green” status.

Run Simulation

▶

User has selected “open” at top left.

Confirming a source file URL or uploading ascenario file will place the hyperlink in the “Available Scenarios” table.

Hyperlink will appear in light blue whenhovered over. Following that, the user has access to three options:

- download file (.csv format, etc)
- duplicate file (adding # after name)
- delete file, prompting a confirm

Order	ID	Production Type	Unit Size	Latitude	Longitude	Status	Days in state	Days left in state

Run Simulation

Export XML

Delete Selected

Filters start out blank, providing appropriate dropdown menus for each filter type.

Each time a filter is selected, a new blank filter dropdown populates below, allowing the user as many filter options as they want.

Arrows only appear when the top item is clicked to toggle between ascending and descending sort.

Export XML if users want to save their modified file, prompting a pop-up naming and destination dialogue.

Delete Selected allows the user to delete multiple lines via shift+click functionality.

Submit

Shift + Click Source Production type to select/deselect types

Click Destination Production type to toggle selection of multiple types

This method controls the amount of information shown, serving as a filter and a transaction point.

Bulk apply will have a dropdown for a new contact rate, but will otherwise assign the contact rate to the selected production types.

Highlighted “spread” should be changed to “rate”

Destruction

Vaccination

Cost Accounting

☐ Use detection

Indicates if disease detection will be modeled for units of this production type.

Detection probability for observed time in clinical

-----

+ Add

Relational function used to define the probability of observing clinical signs in units of this production type.

Detection probability report vs first detection

-----

+ Add

Relational function used to define the probability of reporting clinical signs in units of this production type.

☐ Detection is a zone trigger

Indicator if detection of infected units of this production type will trigger a zone focus.

Submit

Run Simulation

With this method, hyperlinks are nested within the main screen. Clicking on “new” or existing control protocols will slide or fade out the list screen and the user will be able to edit or create the protocol without encountering a pop-up.

Hyperlinks can still navigate the user back to the original screen, prompting a warning if the user has unsaved changes.

Clicking on “+ New Control Spread” or any hyperlinked text in the dropdown bars will open the Spread Creator window that currently exists.

Create a new Control Master Plan

Name\*

☒ Disable all controls

Disable all Control activities for this simulation run. Normally used temporarily to test uncontrolled disease spread.

The number of days that must pass after the first detection before a destruction program can begin.

Destruction capacity

+ Add

The relational function used to define the daily destruction capacity.

Destruction priority order\*

The primary priority order for destruction.

Destruction reason order\*

Basic, Trace fwd direct

The secondary priority order for destruction.

Units detected before triggering vaccination

The number of clinical units which must be detected before the initiation of a vaccination program.

Vaccination capacity

+ Add

Relational function used to define the daily vaccination capacity.

Vaccination priority order\*

>Run Simulation

Disabling all controls should inhibit the user

Grey out everything underneath and prevent interaction with any elements below.

Collapse controls when disabled above
